Creep and Hygrothermal Effects in Concrete Structures

Springer

Contents

Part I Fundamentals

1 Introduction: How the Theory Evolved and How It Impacts Practice 3

2 Fundamentals of Linear Viscoelasticity 9
2.1 Characterization of Creep by Compliance Function 9
2.2 Integral Stress–Strain Relation 18
2.3 Relaxation Function 21
2.4 Viscoelasticity Under Multiaxial Stress 25
2.5 Operator Notation 26

3 Basic Properties of Concrete Creep, Shrinkage, and Drying 29
3.1 Sources and Characterization of Time-Dependent Deformations 29
3.2 Asymptotic Modulus 35
3.3 Basic Creep 37
3.4 Creep Coefficient 42
3.5 Mean Cross-Sectional Shrinkage 43
3.6 Mean Drying Creep in the Cross Section 48
3.7 Common Misconceptions in Measuring and Defining Creep . . . 51
3.7.1 Incompatible Initial Strain 51
3.7.2 Plotting Creep Curves in Actual, Rather than Logarithmic, Time Scale 52
3.7.3 Creep "Inflation" 53
3.7.4 Is Tensile Creep Different from Compression Creep? 53
3.7.5 Autogenous Shrinkage 55

3.8 Updating Long-Time Creep and Shrinkage Predictions from Short-Time Measurements . . . 55
3.8.1 Updating Creep Predictions . . . 56
3.8.2 Difficulties in Updating Shrinkage Predictions . . . 60

4 Structural Effects of Creep and Age-Adjusted Effective Modulus Method . . . 63
4.1 Homogeneous Structures . . . 63
4.1.1 Elastic–Viscoelastic Analogy . . . 64
4.1.2 Change of Structural System . . . 70
4.2 Age-Adjusted Effective Modulus Method . . . 77
4.2.1 Background . . . 77
4.2.2 Fundamental Equation of AAEM . . . 80
4.2.3 Alternative Derivation of AAEM* . . . 82
4.2.4 Ramifications of AAEM . . . 83
4.2.5 Approximation of Relaxation Function . . . 85
4.2.6 Simple Applications of AAEM . . . 89
4.3 Nonhomogeneous Structures . . . 92
4.3.1 Stress Redistributions Due to Differences in Age of Concrete . . . 93
4.3.2 Stress Redistributions in Beams of Composite Cross Section . . . 98
4.3.3 Effects of Nonuniform Drying . . . 104
4.3.4 Stress Relaxation in Prestressed Members . . . 118
4.3.5 Creep Buckling . . . 133
4.3.6 Reduction of Flexural Creep Due to Cracking in Unprestressed Reinforced Concrete . . . 139

5 Numerical Analysis of Creep Problems . . . 141
5.1 Numerical Analysis of Structural Creep Problems Based on History Integrals . . . 141
5.2 Efficient Rate-Type Creep Analysis . . . 153
5.2.1 Generalized Trapezoidal Rule* . . . 154
5.2.2 First-Order Exponential Algorithm* . . . 159
5.2.3 Second-Order Exponential Algorithm . . . 162
5.2.4 Nonaging Kelvin Chain . . . 167
5.2.5 Solidifying Kelvin Unit . . . 170
5.2.6 Solidifying Kelvin Chain . . . 171
5.2.7 Aging Kelvin Unit . . . 173
5.2.8 Aging Kelvin Chain . . . 175

6 Uncertainty Due to Parameter Randomness via Sampling of Deterministic Solutions . . . 177
6.1 Random Parameters in Creep and Shrinkage Model . . . 178
6.2 Latin Hypercube Sampling of Parameters of Creep and Shrinkage Model . . . 182

6.3 Histograms and Statistics of Response, and Confidence Limits for Design . . . 189
6.4 Bayesian Improvement of Statistical Prediction of Creep and Shrinkage Effects* . . . 195
6.4.1 Background on Bayesian Statistics* . . . 197
6.4.2 Method of Bayesian Analysis* . . . 198

7 Paradigms of Application, Phenomena Affecting Creep Deformations, and Comparisons to Measurements on Structures . . . 205
7.1 Drying Effects in Viaduct La Lutrive . . . 206
7.2 Description of the KB Bridge in Palau and Input Data . . . 207
7.3 Creep Structural Analysis Utilizing Commercial General-Purpose Finite Element Program . . . 211
7.4 Numerical Implementation and Algorithmic Aspects . . . 213
7.5 Effects of Slab Thickness, Temperature, and Cracking . . . 216
7.6 Determination of Model Parameters . . . 218
7.7 Results of Simulations and Comparisons to Measurements . . . 221
7.7.1 Calculated Deflections . . . 221
7.7.2 Calculation of Prestress Losses Due to Creep, Shrinkage, Cyclic Creep, and Steel Relaxation . . . 225
7.8 Excessive Long-Term Deflections of Other Box Girders . . . 228
7.9 Approximate Multidecade Extrapolation of Medium-Term Deflection . . . 232
7.10 Uncertainty of Deflection Predictions and Calculation of Confidence Limits . . . 236
7.11 Precautionary Deflection-Minimizing Design and Tendon Layout . . . 237
7.12 Deflection-Mitigating Layout of Tendons . . . 240
7.13 Effect of Cyclic Stress Variations on Creep Compliance . . . 242
7.13.1 History of Cyclic Creep Models . . . 242
7.13.2 Macroscopic Strain Due to Small Growth of Microcracks* . . . 243
7.13.3 Strain According to Paris Law for Subcritical Microcrack Growth* . . . 246
7.13.4 Compressive Cycles via Dimensional Analysis and Similitude* . . . 247
7.13.5 Cyclic Creep Compliance and Multiaxial Generalization . . . 249
7.13.6 Calibration by Existing Test Data . . . 250
7.14 Effects of Cyclic Creep on Bridge Deflections and Cracking . . . 252
7.14.1 Stress Distribution in a Prestressed Cross Section Under Variable Loading . . . 252

7.14.2 Curvature and Residual Stresses Due to Cyclic Creep . . . 255
7.14.3 Appraisal of the Magnitude of Cyclic Creep Effects in Structures . . . 258
7.14.4 Recapitulation . . . 265
7.15 Conclusions for Method of Analysis and Design . . . 266

Part II Advanced Topics

8 Moisture Transport in Concrete . . . 271
8.1 Water in Concrete . . . 272
8.2 Pore Fluids at Thermodynamic Equilibrium . . . 276
8.2.1 Multiphase Porous Medium . . . 276
8.2.2 State Equations . . . 278
8.2.3 Capillary Pressure and Relative Humidity . . . 280
8.2.4 Kelvin Equation . . . 284
8.2.5 Sorption Isotherm . . . 290
8.2.6 Free and Hindered Surface Adsorption, Disjoining Pressure, and Its Continuum Thermodynamics* . . . 294
8.3 Moisture Transport . . . 302
8.3.1 Transport Mechanisms . . . 302
8.3.2 Darcy's Law . . . 303
8.3.3 Mass Balance Equation . . . 309
8.3.4 Differential Equations for Moisture Transport . . . 312
8.3.5 Scaling Properties . . . 320
8.3.6 Effect of Distributed Cracking on the Rate of Drying . . . 321
8.4 One-Dimensional Moisture Transport . . . 323
8.4.1 One-Dimensional Diffusion Equation . . . 323
8.4.2 Numerical Solution by Finite Differences . . . 325
8.4.3 Drying of a Slab . . . 345
8.4.4 Initial Drying and Analysis of Infinite Half-Space . . . 353
8.4.5 Evolution of Total Water Loss from a Specimen . . . 361
8.4.6 Effects of Variable Environmental Humidity . . . 373
8.5 Spreading of Hydraulic Pressure Front Into Unsaturated Concrete . . . 381
8.6 Shrinkage and Stresses Due to Nonuniform Drying . . . 386
8.7 Effects of Self-Desiccation and Autogenous Shrinkage in Drying or Swelling Specimens—A Problem Requiring Further Research . . . 402
8.7.1 Recent Paradigm-Changing Observations . . . 402
8.7.2 Improved Aging Characterization via a Model for Hydration . . . 404
8.8 Creep and Diffusion as Processes Controlling Alkali–Silica Reaction . . . 406

9 Solidification Theory for Aging Effect on Stiffness and Basic Creep 409
9.1 Growth of Volume Fraction of Calcium Silicate Hydrates and Polymerization Hypothesis 410
9.2 Basic Creep Model for Concrete 413
9.3 Basic Creep Compliance Function of Model B3 415
9.4 Absence of a Characteristic Time as the Reason for Using Power Functions* 417
9.5 Asymptotic Matching Properties of Solidification Theory and Insufficiency of Log-Double-Power Law 419
9.6 Nondivergence of Compliance Curves 424
9.7 Change of Sign of Relaxation Function 439
9.8 Thermodynamically Admissible Rheological Chains* 442
9.8.1 General Properties* 442
9.8.2 Relation to Retardation Spectrum* 445

10 Microprestress-Solidification Theory and Creep at Variable Humidity and Temperature 455
10.1 Overview of Physical Mechanisms 456
10.2 Relevant Aspects of Pore Structure and Water Adsorption in Hardened Cement Gel* 458
10.3 The Concept of Microprestress and Its Relaxation 460
10.4 Generation and Relaxation of Microprestress 463
10.5 Unification of Microprestress and Solidification Models 467
10.6 Temperature and Humidity Effects 468
10.6.1 Effects on Creep 468
10.6.2 Hygrometric and Thermal Strains 473
10.7 Alternative Computational Approach: Viscosity Evolution Equation 474
10.8 Numerical Implementation 477
10.8.1 Evaluation of Flow Viscosity 477
10.8.2 Evaluation of Flow Strain Increment 479
10.8.3 Incorporation of Transformed Times 481
10.8.4 Incremental Stress Evaluation Algorithm 482
10.9 Analysis of Experimental Data on Temperature Effect 486
10.9.1 Basic Creep at Constant Elevated Temperature 487
10.9.2 Transitional Thermal Creep 493
10.10 Comment on Applications and Review of Main Points 496

11 Physical and Statistical Justifications of Models B3 and B4 and Comparisons to Other Models 499
11.1 Main Criteria of Evaluation 500
11.2 Theoretically Based Physical Justifications of Model B3* 501
11.2.1 Overview of Mechanisms and Phenomena* 502

11.2.2 Thermodynamic Restrictions* 503
11.2.3 Microprestress Relaxation and the Question of Characterizing Creep Aging by Strength Gain* 504
11.2.4 Activation Energy, Power Laws, and Lack of Bounds* 504
11.2.5 Diffusion Theory for Pore Water* 506
11.2.6 Effect of Cracking* 508
11.3 Statistical Aspects of Model Calibration and Validation 508
11.3.1 Unbiased Statistical Verification of Model 508
11.3.2 Importance of Validating Model Form by Individual Tests on Many Different Concretes* 509
11.3.3 Need for Short-Time Data Extrapolation by Linear Regression 512
11.4 Statistical Methods Applied to Model Evaluation 514
11.4.1 Suppressing Database Bias Due to Nonuniform Sampling of Parameter Ranges 519
11.4.2 Reducing Anti-High-Strength Bias 521
11.4.3 Standard Least-Square Regression Statistics of the Database 522
11.4.4 Bias Due to Different Density of Readings 523
11.5 Statistical Comparison of Creep and Shrinkage Models 523
11.5.1 Model Evaluation by Standard Regression Statistics . . . 523
11.5.2 Statistical Justification of Model B3 524
11.6 Statistical Justification of RILEM Model B4 528
11.6.1 Shrinkage 528
11.6.2 Creep 538
11.7 Analytical Methods for Predicting Concrete Creep from Its Composition* 551
11.7.1 Predicting Creep and Shrinkage from Heterogenous Microstructure Using Homogenization Theory* 552
11.7.2 Extracting Creep Properties of C-S-H via Cement Paste Homogenization* 553

12 Effect of Cracking and Fracture Mechanics Aspects of Creep and Shrinkage Analysis 555
12.1 Limitations of Simplistic Nonlinear Models for Concrete Creep 556
12.2 Fracture Mechanics Aspects and Crack Band Model 557
12.3 Role of Cracking and Irreversibility in Shrinkage 564
12.4 Role of Cracking in Drying Creep (Pickett Effect) 566
12.5 Role of Creep in Cohesive Fracture and Size Effect on Structural Strength 573

12.6 Derivation of Crack Opening Rate Effect from Fracture Kinetics at Atomic Scale* 578
12.7 Models Combining Damage and Creep 582
12.8 Microplane Modeling of Cracking Damage with Creep 594
12.8.1 Basic Ideas of Microplane Modeling 594
12.8.2 Incorporation of Creep with Aging and Shrinkage into Microplane Constitutive Laws 600
12.8.3 The Lattice Discrete Particle Model Generalized for Creep 606
12.9 Why Creep Rate at Low Stress Depends on Stress Linearly . . . 606

13 Temperature Effect on Water Diffusion, Hydration Rate, Creep and Shrinkage 607
13.1 Heat Transfer in Concrete 608
13.1.1 Heat Equation 608
13.1.2 Characteristic Times of Heating and Drying 611
13.1.3 Boundary Conditions for Heat Transfer 613
13.1.4 Role of Heat Convection* 614
13.1.5 Hydration Heat 617
13.1.6 Temperature Increase Induced by Hydration 622
13.2 Heat and Moisture Transfer, and Hygrothermal Effects in Heated Concrete 628
13.2.1 Structure of Bažant–Thonguthai Model 629
13.2.2 Distributed Source of Water 633
13.2.3 Isotherms at High Temperatures 636
13.2.4 Permeability at High Temperatures 641
13.2.5 Thermal Conductivity 645
13.2.6 Heat Capacity 646
13.2.7 Latent Heat 648
13.3 Strains and Stresses at High Temperature 649
13.3.1 Thermal and Hygral Volume Changes 649
13.3.2 Mechanical Properties at High Temperature 651
13.3.3 Extension of Creep Models to High Temperature 653
13.3.4 Application Example: Explosive Thermal Spalling Due to Microwave Heating 658
13.4 Finite Volume Method for Problems with Moving Interfaces* 661
13.5 Mass, Momentum and Energy Balance Laws* 663
13.5.1 Mass Conservation* 663
13.5.2 Momentum Balance* 666
13.5.3 Energy Balance* 668
13.5.4 Entropy Balance* 670
13.5.5 Heat Equation* 675

13.5.6 Balance Laws for Multiphase Media* 679
13.6 Comments on Multiphase Modeling of Hygrothermal Processes and Creep 684

Appendix A: Viscoelastic Rheologic Models 687
A.1 Maxwell Model 688
A.1.1 Compliance Function 688
A.1.2 Relaxation Function 690
A.2 Kelvin Model 691
A.2.1 Compliance Function 691
A.2.2 Relaxation Function 692
A.3 Rheologic Chains 693
A.3.1 Kelvin Chain 694
A.3.2 Maxwell Chain 696
A.4 Aging Rheologic Chains 697
A.4.1 Aging Maxwell Chain 697
A.4.2 Aging Kelvin Chain 699
A.5 Solidifying Rheologic Chains 700
A.5.1 Solidifying Kelvin Chain 700
A.5.2 Solidifying Maxwell Chain 703

Appendix B: Historical Note on Old Creep Models 705

Appendix C: Estimates of Parameters Used By RILEM Model B3 . . . 709
C.1 Sectional Approach 709
C.2 Prediction of Model Parameters 711
C.3 Material Approach 715

Appendix D: Estimates of Parameters Used By RILEM Model B4 . . . 717
D.1 Creep 718
D.1.1 Basic Creep Compliance 718
D.1.2 Additional Compliance Due to Drying 719
D.2 Shrinkage 721
D.2.1 Drying Shrinkage 722
D.2.2 Autogenous Shrinkage 722
D.3 Effect of Admixtures 723
D.4 Simplified Strength-Based Model B4s 723
D.5 Effect of Temperature 725
D.6 Examples of Compliance Curves 727
D.7 Aging Effects 731
D.7.1 Aging of Elastic Modulus 731
D.7.2 Effect of Aging on Creep 738

D.8 Improvements of Model B4 743
D.8.1 Better Prediction of Drying Creep 743
D.8.2 Anticipated Future Improvements of Model B4 749

Appendix E: Creep Models Recommended by Design Codes 751
E.1 General Structure of Creep Design Formulae 751
E.2 CEB and *fib* Model Codes 754
E.2.1 CEB Model 754
E.2.2 *fib* Model 756
E.3 ACI Model 757
E.4 GL2000 Model 759
E.5 JSCE Model 761
E.6 Comparison of Compliance Functions 762

Appendix F: Continuous Retardation Spectrum 767
F.1 Relation Between Compliance Function and Retardation Spectrum 767
F.2 Spectrum of Log-Power Law 771
F.2.1 Straightforward Application of Post-Widder Formula 772
F.2.2 Improved Technique Based on Shifted Retardation Times 777
F.3 Spectra of ACI and CEB Models 779
F.4 Spectrum of Drying Creep Compliance Function of B3 Model 784
F.5 Spectrum of JSCE Model 788
F.6 Spectrum of *fib* Model 790
F.7 Summary 792

Appendix G: Free-Energy Potentials for Aging Linear Viscoelasticity 795

Appendix H: Updating Long-Time Shrinkage Predictions from Short-Time Measurements 807
H.1 Measuring Water Loss to Update Shrinkage Prediction 807
H.2 Procedure of Updating Shrinkage Prediction from Short-Time Tests 810
H.3 Example of Shrinkage Updating 812

Appendix I: Moisture Transport Characteristics 817
I.1 Sorption Isotherms 817
I.2 Sorption Hysteresis Due to Nonuniqueness of Menisci 824

I.3 Permeability 827
I.4 Moisture Diffusivity 828
I.4.1 Dependence of Diffusivity on Humidity 828
I.4.2 Aging of Diffusivity 828

Appendix J: Moisture Transport in Porous Materials 831
J.1 Fick Law 831
J.2 Darcy–Buckingham Law 833
J.3 Richards Model 835
J.4 Coussy Model 836
J.5 Relation to the Bažant–Najjar Model 841
J.6 Künzel Model 842
J.7 Heat and Moisture Transport—Model of Beneš and Štefan 845

Appendix K: Nonstandard Statistics Used in Support of Some Creep and Shrinkage Models 857
K.1 Linear Coefficient of Variation (L.C.o.V.) 857
K.2 CEB Coefficient of Variation 860
K.3 CEB Mean-Square Relative Error 860
K.4 CEB Mean Relative Deviation 861
K.5 Coefficient of Variation of the Data/Prediction Ratios 861
K.6 Why Is the Method of Least Squares the Only Correct Approach to Central Range Statistics? 862
K.7 Comparison of Models by Standard and Nonstandard Statistical Indicators 863
K.8 Stochastic Process for Extrapolating Concrete Creep 865

Appendix L: Method of Measurement of Creep and Shrinkage 867
L.1 Testing Apparatus 867
L.2 Specimens 868
L.2.1 Form and Dimensions 868
L.2.2 Specimen Production 869
L.2.3 Curing 869
L.2.4 Environmental Conditions 869
L.2.5 Companion (or Control) Specimens 870
L.3 Testing Procedure 870
L.3.1 Preparation of Specimens 870
L.3.2 Measurements Prior to Loading 871
L.3.3 Measurements of Total Strain Under Load 871

L.3.4 Measurements of Water Loss 872
L.3.5 Recommended Test Parameters. 872
L.3.6 Reporting of Results 873
L.4 Ring Test of Restrained Shrinkage and Cracking and Its Limitations 873
